                                                                                                                                                                                                                                                                                                The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human breast

                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                               Human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       29-MAR-2000;

          The invention relates to methods to detect the filamentous fungi Byssochlamys nivea, Neosartorya fischeri and Zygosaccharomyces bailii by PCR amplification on genomic DNA using primers derived from the ribosomal internal transcribed spacer (ITS) sequences (see AAT49351-6). This sequence represents the ITS1 from N. neosartorya and is amplified by the primers AAT49359-60. The method is used to detect heat resistant microorganisms of the above species which are important contaminants of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8
                    cown mRNA. The fusions are made by synthesis and in vitro or in situ translation of an mRNA molecule with a peptide acceptor attached to its 3, end. The RNA-protein fusions are incubated under high salt conditions to produce a protein library. This method is useful for improving or altering existing proteins, as well as for isolating new proteins and nucleic acid or small molecule targets. It may also be used to improve human or humanised single-chain antibodies for the treatment of a number of diseases. The method is useful for the isolation of proteins with specific binding properties, for screening cDNA libraries and cloning new method does not rely on maintaining the integrity of an mRNA: ribosome: nascent chain ternary complex, which is very fragile and is therefore of limited use. The method does not rely on topological links between the protein and the nucleic acid so that the information of the protein is retained and can be recovered in readable, nucleic acid form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                  altering existing proteins, as well as for isolating new proteins and nucleic acid or small molecule targets. It may also be used to improve human or humanised single-chain antibodies for the treatment of a number of diseases. The method is useful for the isolation of proteins with specific binding properties, for screening cDNA libraries and cloning new genes on the basis of protein-protein interactions. Unlike prior art, the new method does not rely on maintaining the integrity of an mRNA:ribosome:nascent chain ternary complex, which is very fragile and is therefore of limited use. The method does not rely on topological links
                                                                                                                                                                     tusions, which comprise a protein covalently linked to the own mRNA. The fusions are made by synthesis and in vitro translation of an mRNA molecule with a peptide acceptor a 3' end. The RNA-protein fusions are incubated under high to produce a protein library. This method is useful for including aviation are incubated.
                                                                                                                                                                                                                                                                                                     existing process, -- nroduce RNA-protein fusions
                            therefore of limited use. The between the protein and the protein is retained and can
                                                                                                                                                                                                                                The present sequence was used in a method fusions, which comprise a protein covalent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 03-APR-2002; 2002US-00029386.

RESULT 38
ACH88658/c
      rhe invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe that comparising a plurality of a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-cadressable set of single exon nucleic acid probes for measuring human cells or gene expression (comprising a plurality of single exon nucleic acid probes cited above, where each of the plurality of probes is separately and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of measuring human gene expression, a vector comprising the single exon probe cited above, an ORF-encoded peptide comprising at least 8 contiguous amino acids of any of the above-mentioned amino acid substantials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           methods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing the human gene expression data by subscription, and a computer-readable storage medium which contains a database having a plurality of records (each record including data on the expression of a single exon probe cited above. The probe, methods and apparatus are useful in gene cxpression analysis. The probes may be used as tools for surveying tissues to detect the presence of expressed messages that contain their specific exon, or in constructing genome-derived single exon microarrays. In addition, the probes are used in identifying and characterising calterations in the genomic locus that includes their exon, in assessing salterations in the genomic locus that includes their exon, in assessing calterations in the genomic locus that includes their exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORF-encoded peptide. The present sequence is a human calculated that did not form part of the printed specification, but was obtained in electronic format directly from USPTO at sequence.html?DocID=20030194704
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

nucleic sequence of an open reading frame; for preparing a contig,
conucleic acid molecule from a genome of an organism; and for sequencing
control all or part of a genome of an organism. mRNA is obtained from mammalian
cor human cell which is associated with a pathological condition e.g. a
colon cancer or breast cancer cell. The method is useful for analyses of
copulations of subjects and can be used to carry out genetic analyses of
copulations of subjects and can be used to study living
systems to determine if, e.g. there have been genetic shifts which render
condiseases such as cancer, to determine antibiotic resistance or non-
conference, and so forth. The method can also be used in the study of
through ova or sperm. The analyses for pathological conditions can be
conferenced out in all animals, plants, birds, fish, etc. Using this method,
conference can also be studied in this way. Similarly, the method permits
condition of the pathogens which integrate into the genome, such as
conditions or mutations, which may require different approaches to
therefore shifts or mutations, which may require different approaches to
therefore shifts or mutations, which may require bathogens, such as

                                                                                                                                                                                                                                                                                                                                                                              The invention describes a method of determining open reading frames in CC the genome of organism, comprising contacting mRNA from cell of organism CC with a single oligonucleotide primer (1) at low stringency, preparing CC olNA, sequencing the product, and repeating the contacting, preparing CC olNA, sequencing the product, and repeating the contacting, preparing CC and amplifying steps with different primers and sequencing resulting CC nucleotide sequence from a genome of an organism corresponds to a nucleotide sequence of an open reading frame; for preparing a contig, CC all or part of a genome of an organism; and for sequencing CC nucleotide sequence of an open reading frame; for preparing a contig, CC all or part of a genome of an organism, and for sequencing CC nucleotide sequence of an open reading frame; for preparing a contig, CC all or part of a genome of an organism, and for sequencing CC nucleotide south which is associated with a pathological condition e.g. a colon cancer or breast cancer cell. The method is useful for analyses of CC populations of subjects and can be used to carry out genetic analyses of large or small populations more or less likely to be affilicted with the conditions of subjects and the risk of affiliction to a foetus, as well as CC the study of whether the conditions are likely to be passed to offspring through ove or sperm. The analyses for pathological conditions can be cc using this method, in the area of agriculture, for example the genomes of food crops can be conditied to determine if resistance genes are present, defects in plant CC extracted out in all animals, plants, birds, fish, etc. Using this method, in the area of agriculture, for example the genomes of food crops can be conditioned to determine if resistance genes are present, defects in plant conditions of the pathogens which may require different approaches to the rapy. This method is also applied to eukaryotic pathogens, such as cut reparations, such as conditions of pathological conditions as conditions. This

Such ESTs are not well suited for isolating cDNA derived from the 5' ends of mRNAs and even in those cases wh cDNA sequences have been obtained, the full 5' UTR is rarely ESTs are derived from mRNAs with intact 5' ends and can ther to obtain full length cDNAs and genomic DNAs. 5' ESTs are al diagnostic, forensic, gene therapy and chromosome mapping pr They are used to obtain upstream regulatory sequences and to expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is one of a large number of 5' ESTs mRNAs encoding secreted proteins. No ORF has yet been coridentified within the present sequence. The 5' ESTs were total human RNAs or polyA+ RNAs derived from 30 different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       26-FEB-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design

The invention relates to a corn seedling-derived polynucleotide (cdp) selected from ADS64985-ADS71316, or their complements and fragments. Also composition for the detection of altered expression of a cdp (comprising a polynucleotide selected from ADS64985-ADS71316), a cc method of detecting a polynucleotide in a biological sample using a cdp, cc method of or using oligomers (and amplification) to recover a regulatory clement from a DNA library using oligomers designed against a cdp, a seedling specific regulatory element that regulates the expression of a cc cdp, an expression vector containing a cdp or regulatory element, a plant cransformed with the vector, a host cell containing the vector (and compounds for binding to cdp polynucleotide. TDP), an anti-CDP antibody, compounds for binding to cdp polynucleotide. The cdp polynucleotides, proteins, vectors, cells and antibodies are useful for the cd identification, evaluation and alteration of seed growth and development, consease resistance (e.g. to insect infestation, fungal disease, bacterial consease resistance (e.g. to insect infestation, fungal disease, bacterial stress, ph stress, temperature stress, pollution, injury or consect infestation of seed growth and size dwarf consease. The present segmence is cdb cDNA segmence.
                      water stress, pH stress, remperature according sequence. pesticides. The present sequence is cdp cDNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New corn seedling-derived polynucleotides and polypeptides, useful in identifying and altering desired characteristics associated with growth and development, disease resistance, environmental adaptability, quality

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Selected from ADS64985-ADS71316, or their complements and fragments. Also cincluded are a composition for the detection of altered expression of a comp (comprising a polynucleotide selected from ADS64985-ADS71316), a cdp (comprising a polynucleotide in a biological sample using a cdp, a method of detecting a polynucleotide in a biological sample using a cdp, a cdp, a method for using oligomers (and amplification) to recover a regulatory element from a DNA library using oligomers designed against a cdp, a cdp, an expression vector containing a cdp or regulatory element, a plant cransformed with the vector, a host cell containing the vector (and compounds for binding to cdp polynucleotide. The cdp polynucleotides, compounds for binding to cdp polynucleotide. The cdp polynucleotides, containing, vectors, cells and antibodies are useful for the cdisease resistance (e.g. to insect infestation, fungal disease, bacterial conseaic virus infection) and resistance to environmental stress (e.g. water stress, ph stress, temperature stress, pollution, injury or pesticides. The present sequence is cdp cDNA sequence.

                                                                                                                                                                                                                             The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                             Sequence 185
                                                                                                                                                                                                                                                                                                                                                                                                                          Human
